CaliberGraph: one-page submission decision

DKE candidate assessment — 12 October 2026

Decision: scientific NO_GO. Deliver the complete, truthful manuscript for author review, but do not treat a revised title, clean PDF or engineering repair as evidence of an original publishable contribution. This is an internal scientific assessment, not an editorial decision or acceptance prediction.

Evidence	Supported interpretation
Known multiplicity identities	Assignment-wise derivations hold for the stated separable fragment. Factorization and finite selectors are not new.
Six-arm v5 experiment	Flat gives 23 strict results and selector 22 over 28 exposed configurations; medians show no selector advantage. Cheap AND normalization also resolves the headline case.
Public applicability	Six eligible slots among 48,910; none contains a join. This is a cached recognizer scan, not a solver experiment.
Ten natural query pairs	Four of eight valid pairs reach adapted Polygon: two concrete NEQ and two bounded UNSAT. Four valid pairs remain unadmitted; two inputs are invalid.
SQLite and COUNT diagnostics	Eight synthetic witnesses cover three pairs. Three engineering repairs pass 42 exposed regressions, without full-pipeline certification.

Contribution judgment. The evidence supports a restricted implementation and traceable semantic diagnostics. It does not establish a new mechanism, an automatic general SQLite abstraction, unbounded equivalence, stable speedup, broad natural-query coverage or independent-test accuracy. Recasting the work as a semantic-boundary study does not itself resolve this scientific gap.

Delivery. A full candidate retains the original method, all main experimental denominators and negative findings, and adds the separate natural-query and COUNT evidence. The source package, cover-letter draft, highlights, guide checklist, claim ledger and independent non-author review accompany it. No new SQL, solver or training campaign is part of this integration.

Submission blockers. DKE's current official Guide returned HTTP 403, so page limits, anonymity and mandatory attachments remain unverified. The CCF B historical listing is verified. Human technical verification, author approval, affiliations, contact, CRediT, funding, conflicts, concurrent-submission declarations and complete recoverable AI-version records remain unconfirmed. These cannot be invented or inferred from silence.

Stop condition. Do not submit this candidate merely to meet a deadline. Do not relabel exposed development data as an independent test or one-row UNSAT as general equivalence. Any future claim needs genuinely new evidence under fixed strong baselines and a separate test protocol; this delivery does not launch that work.

Scope. Original frozen materials and P19 remain untouched. No commit, push, external upload or submission was performed. Independent AI review is disclosed as non-author and non-blind; it is not human peer review.
